

Your investment plan

The Trade Sim report - generated on September 27, 2026. How risky is my investment?

Your plan

Amount invested	\$100,000
Time horizon	5 years
Approach	Balanced - Aim for the expected gain, and sit through a normal bad year. Goal ~100% of the expected gain, loss limit ~1.25x the typical yearly swing.
Method	Statistical model - 1,000 scenarios
Costs	0.3% yearly fees; results in today's money (2.5% inflation); dividends reinvested
What-if events	none
Data	daily prices since Sep 2016, 10 years, converted to US dollars

Where the money goes

Investment	Kind	Share	Amount
Apple (US)	Stocks	30%	\$30,000
NVIDIA (US)	Stocks	20%	\$20,000
Amazon (US)	Stocks	20%	\$20,000
Blackstone (US)	Stocks	30%	\$30,000

What the next pages show

One page for the whole mix, then one for each investment, each with: the risk level, the four outcomes (a bad, a likely and a good scenario, and the chance of ending with less), a chart of where the money could go, what happens to your goal and loss limit, and what the past looked like. The last page explains the growth rates used and how much to trust the numbers. In the app, the lines can be dragged and the charts zoomed; here they're fixed at your approach's defaults over the full horizon.

Your whole mix

\$100,000 invested across Apple (US) 30%, NVIDIA (US) 20%, Amazon (US) 20%, Blackstone (US) 30%

Risk level: **Very high** - wild ups and downs; you could lose a large part of it

If things go badly \$71,022 -29% vs start - only 1 in 10 scenarios ends worse	Most likely \$169,470 +69% vs start - half end above, half below	If things go well \$407,380 +307% vs start - only 1 in 10 scenarios ends better	Chance of ending with less 22% of scenarios end below \$100,000
--	---	--	--

After 5 years, your money would most likely be worth about \$169,470. If things go badly you'd have around \$71,022; if they go well, around \$407,380. There's a 22% chance you'd end up with less than you put in.

Goal and loss limit (Balanced approach)

Goal +69% (\$168,777), loss limit -43% (\$57,540), checked over 5 years. A scenario ends as soon as it touches either line.

Scenario	What happens	When and how much
If things go badly	You hit your loss limit	after 2.0 years, with \$57,540
Most likely	You reach your goal	after 3.1 years, with \$168,777
If things go well	You reach your goal	after 11 months, with \$168,777

Goal reached first: 64% (typically after 1.9 years); loss limit hit first: 18% (typically after 1.9 years); neither: 17%, ending between \$74,114 and \$143,526.

What the past 10 years looked like

Average growth per year	Yearly swings	Worst fall from a peak	Growth per unit of risk
43.1%	±34.2%	-48.1%	1.26

Apple (US)

\$30,000 of your money (30.0% of the mix)

Risk level: **High** - big ups and downs; expect some scary drops

If things go badly

\$19,794

-34% vs start - only 1 in 10 scenarios ends worse

Most likely

\$46,617

+55% vs start - half end above, half below

If things go well

\$113,178

+277% vs start - only 1 in 10 scenarios ends better

Chance of ending with less

26%

of scenarios end below \$30,000

After 5 years, the \$30,000 in Apple (US) would most likely be worth about \$46,617. If things go badly you'd have around \$19,794; if they go well, around \$113,178. There's a 26% chance you'd end up with less than you put in.

Goal and loss limit (Balanced approach)

Goal +55% (\$46,199), loss limit -36% (\$19,006), checked over 5 years. A scenario ends as soon as it touches either line.

Scenario	What happens	When and how much
If things go badly	You hit your loss limit	after 1.3 years, with \$19,006
Most likely	You reach your goal	after 2.6 years, with \$46,199
If things go well	You reach your goal	after 7 months, with \$46,199

Goal reached first: 64% (typically after 1.4 years); loss limit hit first: 26% (typically after 1.7 years); neither: 10%, ending between \$25,250 and \$37,845.

What the past 10 years looked like

Average growth per year	Yearly swings	Worst fall from a peak	Growth per unit of risk
29.5%	±29.1%	-38.5%	1.01

NVIDIA (US)

\$20,000 of your money (20.0% of the mix)

Risk level: **Very high** - wild ups and downs; you could lose a large part of it

If things go badly

\$7,381

-63% vs start - only 1 in 10 scenarios ends worse

Most likely

\$31,423

+57% vs start - half end above, half below

If things go well

\$130,032

+550% vs start - only 1 in 10 scenarios ends better

Chance of ending with less

34%

of scenarios end below \$20,000

After 5 years, the \$20,000 in NVIDIA (US) would most likely be worth about \$31,423. If things go badly you'd have around \$7,381; if they go well, around \$130,032. There's a 34% chance you'd end up with less than you put in.

Goal and loss limit (Balanced approach)

Goal +57% (\$30,852), loss limit -60% (\$8,056), checked over 5 years. A scenario ends as soon as it touches either line.

Scenario	What happens	When and how much
If things go badly	You hit your loss limit	after 1.6 years, with \$8,056
Most likely	You reach your goal	after 1.5 years, with \$30,852
If things go well	You reach your goal	after 4 months, with \$30,852

Goal reached first: 73% (typically after 12 months); loss limit hit first: 24% (typically after 1.9 years); neither: 4%, ending between \$10,686 and \$22,652.

What the past 10 years looked like

Average growth per year	Yearly swings	Worst fall from a peak	Growth per unit of risk
64.3%	±50.0%	-66.3%	1.29

Amazon (US)

\$20,000 of your money (20.0% of the mix)

Risk level: **Very high** - wild ups and downs; you could lose a large part of it

If things go badly \$10,517 -47% vs start - only 1 in 10 scenarios ends worse	Most likely \$29,278 +46% vs start - half end above, half below	If things go well \$77,654 +288% vs start - only 1 in 10 scenarios ends better	Chance of ending with less 29% of scenarios end below \$20,000
---	---	--	--

After 5 years, the \$20,000 in Amazon (US) would most likely be worth about \$29,278. If things go badly you'd have around \$10,517; if they go well, around \$77,654. There's a 29% chance you'd end up with less than you put in.

Goal and loss limit (Balanced approach)

Goal +46% (\$28,970), loss limit -41% (\$11,875), checked over 5 years. A scenario ends as soon as it touches either line.

Scenario	What happens	When and how much
If things go badly	You hit your loss limit	after 1.3 years, with \$11,875
Most likely	You reach your goal	after 1.9 years, with \$28,970
If things go well	You reach your goal	after 5 months, with \$28,970

Goal reached first: 68% (typically after 1.0 years); loss limit hit first: 28% (typically after 1.7 years); neither: 4%, ending between \$14,161 and \$23,372.

What the past 10 years looked like

Average growth per year	Yearly swings	Worst fall from a peak	Growth per unit of risk
20.1%	±33.1%	-56.1%	0.61

Blackstone (US)

\$30,000 of your money (30.0% of the mix)

Risk level: **Very high** - wild ups and downs; you could lose a large part of it

If things go badly \$14,197 -53% vs start - only 1 in 10 scenarios ends worse	Most likely \$43,752 +46% vs start - half end above, half below	If things go well \$122,987 +310% vs start - only 1 in 10 scenarios ends better	Chance of ending with less 33% of scenarios end below \$30,000
---	---	---	--

After 5 years, the \$30,000 in Blackstone (US) would most likely be worth about \$43,752. If things go badly you'd have around \$14,197; if they go well, around \$122,987. There's a 33% chance you'd end up with less than you put in.

Goal and loss limit (Balanced approach)

Goal +46% (\$43,898), loss limit -45% (\$16,254), checked over 5 years. A scenario ends as soon as it touches either line.

Scenario	What happens	When and how much
If things go badly	You hit your loss limit	after 1.5 years, with \$16,254
Most likely	You reach your goal	after 1.8 years, with \$43,898
If things go well	You reach your goal	after 4 months, with \$43,898

Goal reached first: 68% (typically after 12 months); loss limit hit first: 25% (typically after 1.7 years); neither: 7%, ending between \$18,757 and \$36,989.

What the past 10 years looked like

Average growth per year	Yearly swings	Worst fall from a peak	Growth per unit of risk
21.9%	±36.0%	-49.3%	0.61

How much to trust this

These are not predictions. The size and timing of the ups and downs come from the last 10 years. The spread is more trustworthy than the middle: in a back-test on 20+ years of history the bands held up well for broad stock funds over 1-3 years. The most likely number is a judgment call, anchored to long-run averages rather than to the past decade. At 5 years and beyond, treat the numbers as an illustration of risk, not a forecast.

Expected growth per year used in the scenarios

The past decade counts for 25%, a long-run anchor for 75% (stocks 7%, bonds the current 10-year Treasury yield of 4.0%, crypto 8%), kept within $\pm 5\%$ of the anchor, minus 0.3% fees.

Investment	Past decade	Long-run anchor	Used in the scenarios
Apple (US)	29.5%	7.0%	11.7%
NVIDIA (US)	64.3%	7.0%	11.7%
Amazon (US)	20.1%	7.0%	10.0%
Blackstone (US)	21.9%	7.0%	10.4%

Statistical model: shocks follow a Student-t with 4.9 degrees of freedom (fatter tails than a bell curve); stressed periods cover 28% of days, last about 21 trading days and carry 1.4x the usual swings, all measured on your investments' history.

- Past decade tamed: Apple (US) (29.5% ? 11.7%), NVIDIA (US) (64.3% ? 11.7%), Amazon (US) (20.1% ? 10.0%), Blackstone (US) (21.9% ? 10.4%). These grew unusually fast; the scenarios use the anchored rate instead, so the most likely outcome is far less rosy than the past.

Words explained

Scenario: One possible future the simulator plays out. We run thousands and look at how they spread.

Most scenarios / likely zone: The light band holds 8 in 10 scenarios; the darker band holds the middle half.

Most likely: The middle result: half the scenarios end higher, half end lower.

If things go badly / well: The result that only 1 in 10 scenarios is worse than, or better than.

Yearly swings: How much the value typically moves up or down in a year. Also called volatility.

Worst fall from a peak: The biggest drop from a high point to a low point in the past. Also called maximum drawdown.

Goal / loss limit: The gain you'd sell at, and the loss you wouldn't accept. Traders call them target and stop-loss.

Bonds: You lend money to a government or company and get it back with interest. Usually steadier than stocks.

ETF / index fund: A single product that holds many stocks or bonds at once, so you're spread out.
